## Kinetic Axion from non-minimally coupled PQ Field

*Thursday 29 May 2025 14:20 (20 minutes)*

Axion Kinetic Misalignment can be generated by higher-order operators that explicitly break the PQ symmetry at very high energies. This results in a kick in the angular direction of the PQ field, causing a delay in the onset of axion oscillations. For the higher-order operator to be relevant, the PQ radial mode must reach very high values. We explore the possibility that a non-minimally coupled PQ field, with a term, combined with a stiff era, can generate the exact initial conditions for a Kinetic Misalignment Mechanism.
