

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider

Elisa Di Meco on behalf of the Crilin Calorimeter group

aMUSE General Meeting Workshop YSF - Padova, Italy, Sept 18, 2024

Crilin (crystal calorimeter with longitudinal information): ECAL R&D for the future Muon Collider, which is being considered as an option for a next generation facility; studies for 3 and 10 TeV designs are being carried out.

Muon Collider pros:

- m_μ>>m_e (negligible synchrotron radiation)
- **point-like particle:** all energy is available in collisions
- perfect for direct search of heavy states

Muon Collider cons:

- τ₀= 2.2µs : very fast cooling and fastramping magnet system needed
- µ decay + interaction with machine:
 beam-induced background (BIB), partially shielded by nozzles

 \rightarrow detectors must be able to cope with the BIB and to have good physics performances

Muon Collider requirements

BIB hits in the calorimeters

BIB in the ECAL region (after nozzles and tracking system):

- Flux of 300 particles per cm² through the ECAL surface mainly γ (96%) and n (4%), average photon energy 1.7 MeV
- **Time of arrival flatter** throughout the bunch crossing → can exclude most of BIB with an acquisition window of ~240 ps
- Different hit longitudinal profile wrt signal
- Total lonising Dose: ~1 kGy/year
- Neutron fluence: 10¹⁴ n_{1MeVneq}/cm² / year

- a MC ECAL should have:
- σt ~ 80 ps
- longitudinal segmentation
- fine granularity to distinguish BIB and signal
- radiation resistance
- σε/E~ 10%/√E

→ The W-Si sampling calorimeter (CALICE-like) stands out as a strong contender: initially considered as the primary candidate.

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

Crilin is a semi-homogeneous electromagnetic calorimeter made of crystal matrices interspaced and readout by **SiPMs.** Each crystal is independently read by 2 channels, each consisting of 2 SiPMs in series.

Key Features:	Crystal choice:	Differentiation:	
Excellent timing : (<100 ps) to reject the BIB out- of-time hits and for good pileup capability.	High-density crystal: selected to balance the need for increased layer numbers with space constraints	Semi-homogeneous : strategically between homogeneous and sampling calorimeters \rightarrow able to exploit the strengths of both kinds	
Longitudinal segmentation: allows to recognize fake showers from the BIB.	Speed response: Cherenkov/fast crystals, ensuring accurate and timely particle	Flexibility: able to modulate energy deposition for each cell and adjust crystal size for tailored solutions Compactness: Unlike segmented or high granularity calorimeters CRILIN can optimize energy detection while staying compact	
Fine granularity: reduced hit density in a single cell and distinguish the BIB hits from the signal.	PbF2, PbWO₄-UF, LYSO		
Good resistance to radiation: good reliability during the experiment	<u>S. Ceravolo et al 2022 JINST 17 P09033</u>		
Sept 18 2024 Crilin: a semi-homog	eneous calorimeter solution for the future Muor	n Collider - E. Di Meco 4/16	

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

> 5 layers of 45 mm length, 10 X 10 mm² cell area \rightarrow 21.5 X₀

> In each cell: 40 mm PbF₂ + 3 mm SiPM + 1 mm electronics + 1 mm air

See C. Giraldin's talk

- Design optimized for BIB mitigation: having thicker layers, the BIB energy is integrated i
- Design optimized for BIB mitigation: having thicker layers, the BIB energy is integrated in large volumes
 → reduced statistical fluctuations of the average energy
- 5 layers wrt to 40 layers of the W-Si calorimeter → factor 10 less in cost (6 vs 64 Mchannels)

Prototype versions

- Proto-0 (2 crystals \rightarrow 4 channels)
- Proto-1 (3x3 crystals x 2 layers → 36 channels)

Front-end electronics

- Design completed
- Production and QC completed

Radiation hardness campaigns

See E. Diociaiuti's talk

Beam test campaigns

- Proto-0 at CERN H2 (August 2022)
- Proto-1 at LNF-BTF (July 2023-April 2024)
- Proto-1 at and CERN (August 2023)

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

Mechanics:

- Two stackable and interchangeable submodules assembled by bolting, each composed of 3x3 crystals+36 SiPMs (2 channel per crystal)
- light-tight case which also embeds the front-end electronic boards, and the heat exchanger needed to cool down the SiPMs.

Electronics:

- SiPMs board: custom SiPM array board 36x10 µm Hamamatsu SMD SiPMs
- Mezzanine board: 18x readout channels → amplification, shaping and individual bias regulation, slow control routines

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

- Crystals tested with two different wrapping, Teflon and Mylar, up to 80 kGy
- · LY loss evaluated through variation in charge and number of photo-electrons

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

Beam test @ BTF: considerations UON Collider

- Considerable variability in crystals' response to radiation, despite SICCAS claiming use of high-purity (>99.9%) PbF₂ powder for crystal growth
- Crystals evident loss of transparency
- Transparency loss was uniform length-wise in the crystals
- Teflon was damaged and brittle
- SiPM dark counts increases significantly with the absorbed dose
- New tests planned to evaluate SiPMs PDE loss and optical grease degradation

No dose 80 kGy dose

Sept 18 2024

Collaboration

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

- **Time resolution**: < 40 ps for single crystals, for $E_{dep} > 1$ GeV
- **Radiation resistance:** $PbF_2(PbWO_4-UF)$ robust to > 35(200) Mrad and SiPMs validated up to 10¹⁴ n_{1MeV}/cm² displacement-damage eq. fluence
- Use PbWO-UF or LYSO in the first calorimeter layer. Conduct new irradiation tests and monitor Cherenkov light variations with a blue laser.
 - Simultaneously test crystals with SiPM and SiPM alone

Next steps (2024 - 2025)

- We submitted and won a PRIN grant for the project >CALORHINO: an innovative radiationhard calorimeter proposal for a future Muon Collider Experiment.
 - \rightarrow founds assigned to develop a 5x5x4 (layers) Crilin prototype: $1 M_{\rm B} - 16.8 X_{\rm O}$

DRD6-WP3 from 2025

Expanding upon the PRIN prototype to a 9x9x5(layers) \geq configuration, with a target of 2 $M_{\rm B}$ – 22 X_0 .

Developing an alternative calorimeter solution for the future Muon Collider - E. Di Meco

By setting a threshold similar to that expected for the Muon Collider (i.e. 40 MeV) per crystal, we
optimized the number of crystals, with the goal of minimizing the energy resolution loss → optimization
performed for an electron beam with 100 GeV of energy.

• The sixth layer is crucial for maximizing energy resolution → longitudinal leakage creates a much larger energy fluctuation compared to lateral leakage (for the same amount of leakage).

• 7x7 in layers 2, 3, 4, and 5, and 5x5 in layers 1 and $6 \rightarrow \sim 250$ crystals in total.

Design, Testing, and Radiation Resistance of the Crilin Calorimeter Prototype - I. Sarra

Crystal radiation hardness UON Collider Collaboration

Neutron fluence: ~ $10^{14}n_{1MeVeq}/cm^2$ year on ECAL TID: ~ 1 kGy/ year on ECAL.

Radiation hardness of two PbF₂ and PbWO₄-UF crystals (10x10x40 mm³) checked for TID and neutrons

- For PbF₂:
 - \succ after a TID > 350 kGy no significant decrease in transmittance observed.
 - Transmittance after up to 10¹³ n/cm² irradiation showed no deterioration
- For PbWO₄-UF:
 - \rightarrow after a TID > 2 MGy no significant decrease in transmittance observed.

Sept 18 2024

Crilin: a semi-homogeneous calorimeter solution for the future Muon Collider - E. Di Meco

$$\label{eq:logical_states} \begin{split} & \text{Neutron fluence:} \sim 10^{14} n_{1\text{MeVeq}} / \text{cm}^2 \text{ year on ECAL} \quad \text{TID:} \sim 1 \text{ kGy/ year on ECAL}. \end{split}$$

Neutrons irradiation: 14 MeV neutrons with a total fluence of 10^{14} n/cm² for 80 hours on a series of two SiPMs (10 and 15 μ m pixel-size).

Extrapolated from I-V curves at 3 different temperatures:

- Currents at different operational voltages.
- Breakdown voltages;

For the expected radiation level, the best SiPMs choice are the 10 μ m ones for their minor dark current contribution. 15 μ m pixel-size

Design, Testing, and Radiation Resistance of the Crilin Calorimeter Prototype - I. Sarra

Crilin Module Prototype

1.Aluminum matrix to hold the crystals:

- 1. 50 μ m thickness between crystals
- 2. Thicker (~ 2mm) in the external envelope with channels for cooling

2.Kapton strip for polarization and output signal:

1. Aluminum matrix to hold the crystals:

- 1.50-100 µm thickness between crystals
- 2. Thicker (~ 2mm) in the external envelope with micro channels for cooling

2. Kapton strip for polarization and output signal:

1. Handles polarization and output signals for each channel of two SiPMs in series.

3. Connectors at the back of the 5 assembled modules.
